Wallace Artificial Insemination Catheters

The Wallace Artificial Insemination Catheter is designed to optimise the chances of conception. Evidence suggests that sparing the three-layer endometrium from damage during IUI increases the chance of conception.¹

- Insemination with the Wallace IUI catheter was associated with less trauma to the endometrium compared with a competitor catheter¹
- Bilateral smooth side eyes aid dispersion of sperm preventing contamination and blockage during insertion

Designed to optimise the chances of conception

The Wallace IUI catheter has a rounded tip to ease insertion through the cervix, minimising pain and trauma.

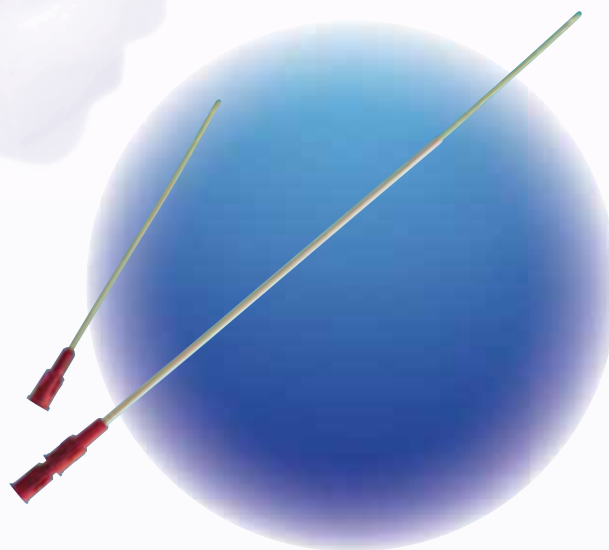

Insemination with the Wallace IUI catheter was associated with less trauma to the endometrium compared to a competitor catheter.¹

Bilateral smooth side eyes aid dispersion of sperm and prevent contamination and blockage during insertion.

Range includes 18cm intrauterine and 8cm intracervical catheter.

Ordering information

Description	Quantity	Order Code
Artificial Insemination Catheters		
Intrauterine insemination catheter (18cm)	10	AIC18
Intracervical insemination catheter (8cm)	10	AIC8
Stylet to aid insertion of 18cm catheter	10	1816ST
