Are you OPEN to new ways of thinking about secretion management?
Principal interventions for secretion mobilization and removal.

Positive Airway Pressure (PAP) therapy, which also includes Positive Expiratory Pressure (PEP) therapies, is used as part of a broader bronchial hygiene therapy program for the mobilization and removal of secretions, particularly in patients with atelectasis, COPD and cystic fibrosis. It can successfully:

- Reduce air trapping, common with asthma and COPD
- Aid in the mobilization of retained secretions as are found in cystic fibrosis and chronic bronchitis
- Prevent or reverse atelectasis
- Optimize the delivery of bronchodilators

Smiths Medical’s specialized products can provide these therapeutic benefits across the continuum of care.
Effective therapies tailored to specific respiratory needs

**Smiths Medical**

Offering secretion management solutions for hospital care, home care and life.

Smiths Medical can help you achieve more successful interventions and enhanced outcomes with:

- A full portfolio of products that target the treatment of chronic and hyper secretions
- Unique, proprietary products for PAP and vibratory PEP therapy
- A compendium of clinical evidence to support the clinical results and outcomes
- Products that are easy to use and register high patient compliance
- Patient educational materials including videos
- Protocol and care pathways developed by clinicians
- Clinical education programs

We’re ready to share our new approach with you.
